#M6064 *Exclusive* Anti-Drip Valve

This kit will greatly reduce misting nozzle dripping by bleeding off line pressure.

Connect the valve to your misting line at any location as high or higher than your misting nozzles. (If placed too low, the valve will allow the entire system to drain. The intent is to bleed off pressure, not empty the water line.) Place water can under the end of the hose to collect the run-off for your plants.

Turn on the misting system and adjust the Anti-Drip Valve to allow a slow trickle of water to escape. When you turn the misting system off, the water will continue to bleed off through the hose for a few seconds, but the nozzles should stop dripping very quickly. Adjust the valve until you are satisfied with the timing and amount of bleed-off.
